Related Information:

1. For the purposes of monitoring and analysing the commercial property market, the Real Estate Market Analysis Section of the Bank of Greece compiles office and retail property indices, using data from credit institutions (Bank of Greece Executive Committee Act 23/26.07.2013) and Real Estate Investment Companies - REICs - operating in Greece (Bank of Greece Executive Committee Act 9/10.01.2013), as well as data from other sources, e.g. private real estate consultants, portfolio managers, real estate developers, real estate brokers and public sector entities. The data are collected on a biannual basis and include valuations, rents, transactions, investments and yields of commercial property and commercial property asset portfolios.

2. Indices are published on a biannual basis (base year: 2010) and cover office and retail uses. Price indices represent prime investment property and are valuation-based and not actual transactions. Therefore, the respective indices are expected to show relative lag, especially in cases of negative changes. Furthermore, in periods of limited transactions, the values tend to reflect sentiment and market expectations at the moment of the valuation. Finally, it is noted that indices reflect price and rent levels at the end of each reference period.
